Aggregate functions and set operators

- The learning objectives for this week are:
 - Knowing what kind of query problems aggregate functions solve
 - Knowing how to use the aggregate functions COUNT, SUM, AVG, MIN and MAX
 - Knowing what kind of query problems set operators solve
 - Knowing how to combine result tables with UNION, EXCEPT and INTERSECT set operators

Aggregate functions

- Performing some calculation for multiple rows so that the end result is a single value is a common query problem
- Example of such query is calculating the count of rows, or sum of a column values in a certain table
- For example, "what is the total number of courses?", or "what is the sum of male teachers' salaries?"
- Functions that perform such operations are referred to as aggregate functions

```
COUNT ( * | { [ DISTINCT ] column_expression } )
```

The COUNT aggregate function returns the total number of rows that match the specified criteria:

```
-- what's the number of courses in the Course table?

SELECT COUNT(*) as number_of_courses FROM Course
```

```
number_of_courses
7
```

■ We can also filter the rows the aggregate function operates on using the WHERE clause:

```
-- what's the number of courses with more than 3 credits?
SELECT COUNT(*) as number_of_courses FROM Course
WHERE credits > 3
```

```
number_of_courses
2
```

• We can also provide a column name for the COUNT aggregate function in which case the function returns the number of the **non-null value** of the given column:

```
-- what's the number of students with an email address?

SELECT COUNT(email) as number_of_students_with_email

FROM Student
```

student_number	email
o354	0354@takkula.fi
o410	0410@takkula.fi
o473	NULL

```
-- count all rows, total_number_of_students is 3

SELECT COUNT(*) as total_number_of_students

FROM Student

-- count rows with non-null email column value, number_of_students_with_email is 2

SELECT COUNT(email) as number_of_students_with_email

FROM Student
```

The SUM aggregate function

```
SUM ( [ DISTINCT ] column_expression )
```

■ The SUM aggregate function returns the **sum of all the values** of a column:

```
-- what's the sum of salaries of female teachers?
SELECT SUM(salary) as sum_of_salaries FROM Teacher
WHERE gender = 'F'
```

```
sum_of_salaries
102273.00
```

The AVG aggregate function

```
AVG ( [ DISTINCT ] column_expression )
```

■ The AVG aggregate function returns the **average value** of a column:

```
-- what's the average grade from course with code "a730"?
SELECT AVG(grade) as average_grade FROM CourseGrade
WHERE course_code = 'a730'
```

```
average_grade

3
```

The AVG aggregate function

- Calculating the average includes a division operation, which can produce decimal numbers
- To avoid losing the decimal part of the average, we need to cast integer column values to a DECIMAL type:

```
-- multiplying an integer with 1.0 will end up with a DECIMAL type
SELECT AVG(grade * 1.0) as average_grade FROM CourseGrade
WHERE course_code = 'a730'
```

average_grade

3.333333

The AVG aggregate function

We can limit the number of decimal places in the result by using casting the result to a
 DECIMAL type with specific precision (the total number of decimal digits stored) and scale
 (the number of decimal digits stored to the right of the decimal point):

```
-- use scale of 2 in the DECIMAL type to round to two decimals places

SELECT CAST(AVG(grade * 1.0) AS DECIMAL(9, 2)) as average_grade

FROM CourseGrade

WHERE course_code = 'a730'
```

average_grade

3.33

The MIN aggregate function

```
MIN ( column_expression )
```

■ The MIN function returns the **smallest value** of a column

```
-- what's the lowest grade from course with code "a730"?

SELECT MIN(grade) as lowest_grade FROM CourseGrade

WHERE course_code = 'a730'
```

```
lowest_grade
1
```

The MAX aggregate function

```
MAX ( column_expression )
```

■ The MAX function returns the **largest value** of a column

```
-- what's the highest grade from course with code "a730"?
SELECT MAX(grade) as highest_grade FROM CourseGrade
WHERE course_code = 'a730'
```

```
highest_grade
5
```

Multiple aggregate functions in a single query

We can have multiple aggregate functions in the same query:

```
-- what's the highest and lowest grade from course with code "a730"?
SELECT MAX(grade) as highest_grade, MIN(grade) as lowest_grade FROM CourseGrade
WHERE course_code = 'a730'
```

The result table contains a single row with two columns:

highest_grade	lowest_grade
5	1

Only operating on distinct values

■ The COUNT, SUM and AVG aggregate functions support the DISTINCT keyword for only operating on **distinct values**:

```
-- how many different grades have been given?
SELECT COUNT(DISTINCT grade) as number_of_different_grades FROM CourseGrade
```

Combining aggregate function and non-aggregate function columns

If we use an aggregate function, we can't include non-aggregate function columns to the SELECT statement*:

```
-- ☑ only aggregate function columns, all good here

SELECT COUNT(*) as number_of_courses FROM Course

-- ✗ combintation of aggregate function and non-aggregate function columns, this won't work

SELECT course_name, COUNT(*) as number_of_courses FROM Course
```

• * That is, unless the non-aggregate function columns are included in a GROUP BY clause, but we will cover that later

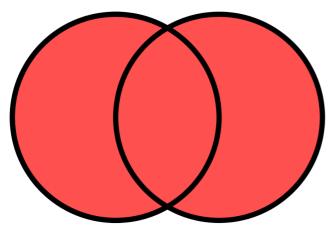

Combining aggregate function and non-aggregate function columns

• If it would be possible, how would the RDMS know, which course_name to display in the result table?

```
-- X combintation of aggregate function and non-aggregate function columns, this won't work SELECT course_name, COUNT(*) as number_of_courses FROM Course
```

course_name	number_of_courses
?	2

Combining results tables with set operators

- We can use the results from multiple result tables using the UNION, EXCEPT, and INTERSECT set operators
- For example, the UNION operator returns all the rows from two or more result tables without duplicate values:

```
-- what are all the surnames among teachers and students?

SELECT surname FROM Teacher

UNION

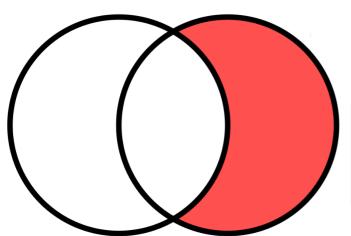

SELECT surname FROM Student
```

The UNION operator

"What are all the surnames among teachers and students?"

SELECT surname FROM Teacher	SELECT surname FROM Student	SELECT surname FROM Teacher UNION	
surname	surname	SELECT surname FROM Student	
Huhta	Kokki	surname	
Hellerus	Kuikka	Huhta	
		Hellerus	
		Kokki	
		Kuikka	

The EXCEPT operator

The EXCEPT operator returns only the rows from the first result table that are not included in the second result table without duplicate values:

```
-- what are the campus cities that no student lives in?

SELECT city FROM Campus

EXCEPT

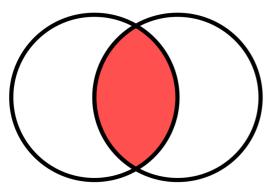

SELECT city FROM Student
```

The EXCEPT operator

"What are the campus cities that no student lives in?"

SELECT city FROM Campus	SELECT city FROM Student	SELECT city FROM Campus EXCEPT
city	city	SELECT city FROM Student
Helsinki	Helsinki	city
Vantaa	Espoo	Vantaa

The INTERSECT operator

The INTERSECT operator returns only the rows that exist in both result tables without duplicate values:

```
-- what are the campus cities that have students living in them?

SELECT city FROM Campus

INTERSECT

SELECT city FROM Student
```

The EXCEPT operator

"What are the campus cities that have students living in them?"

SELECT city FROM Campus	SELECT city FROM Student	SELECT city FROM Campus EXCEPT
city	city	SELECT city FROM Student
Helsinki	Helsinki	city
Vantaa	Espoo	Helsinki

The set operators

• With set operators, the column names and data types of each SELECT statement must match:

```
-- X first_name column is missing from the latter SELECT statement.
-- This will lead into an error.

SELECT surname, first_name FROM Teacher

UNION

SELECT surname FROM Student
```

Summary

- We can perform calculations on multiple rows so that the end result is a single row using aggregate functions
- The COUNT aggregate function returns the total number of rows
- The SUM aggregate function returns the sum of all the values of a column
- The AVG aggregate function returns the average of values of a column
- The MIN aggregate function returns the minimum value of a column
- The MAX aggregate function returns the maximum value of a column
- The UNION, EXCEPT and INTERSECT set operators can be used to combine results of multiple result tables
